THE MECHANICS OF SURVIVAL

Cardiac Hydraulics, Acid-Base Alchemy, & Artificial Bellows

DIRECTIVES FOR ADVANCED PHYSIOLOGY INITIATES

NotebookLM

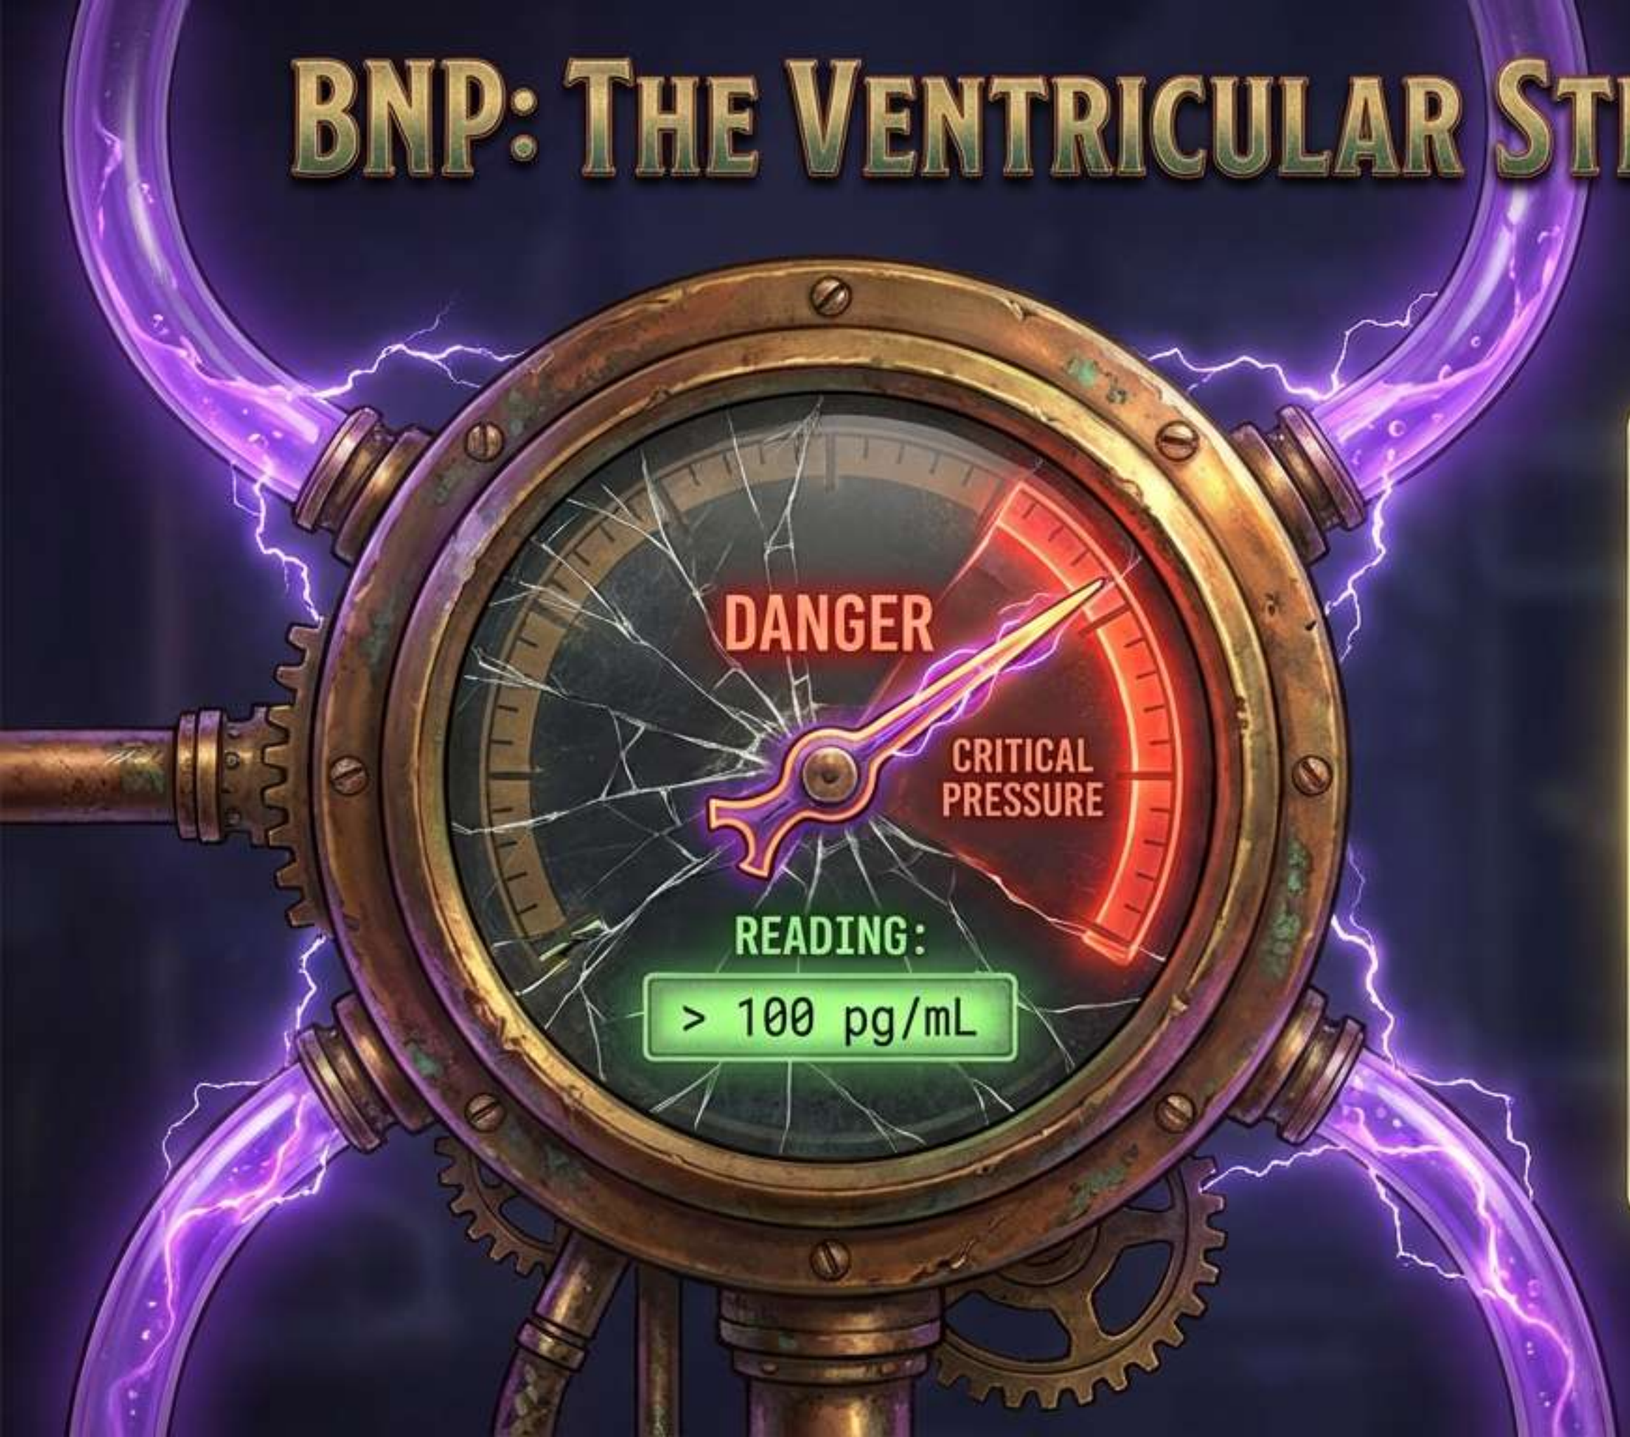
The Hydraulic Integrity Check

Quantifying Pump Stress vs. Engine Failure

Biomarker Analysis: Pressure Overload (BNP) & Myocardial Damage (Troponin).

NotebookLM

BNP: The Ventricular Stretch Gauge



SECRETION TRIGGER:
Excessive Ventricular Stretching.

INDICATOR:
Congestive Heart Failure (CHF).

NORMAL RANGE:
< 100 pg/mL (Safe Pressure).

CRITICAL READOUT:
> 100 pg/mL (Hydraulic Overload).

PROTOCOL:
Unload the System. Administer Loop Diuretics (Furosemide).

NotebookLM

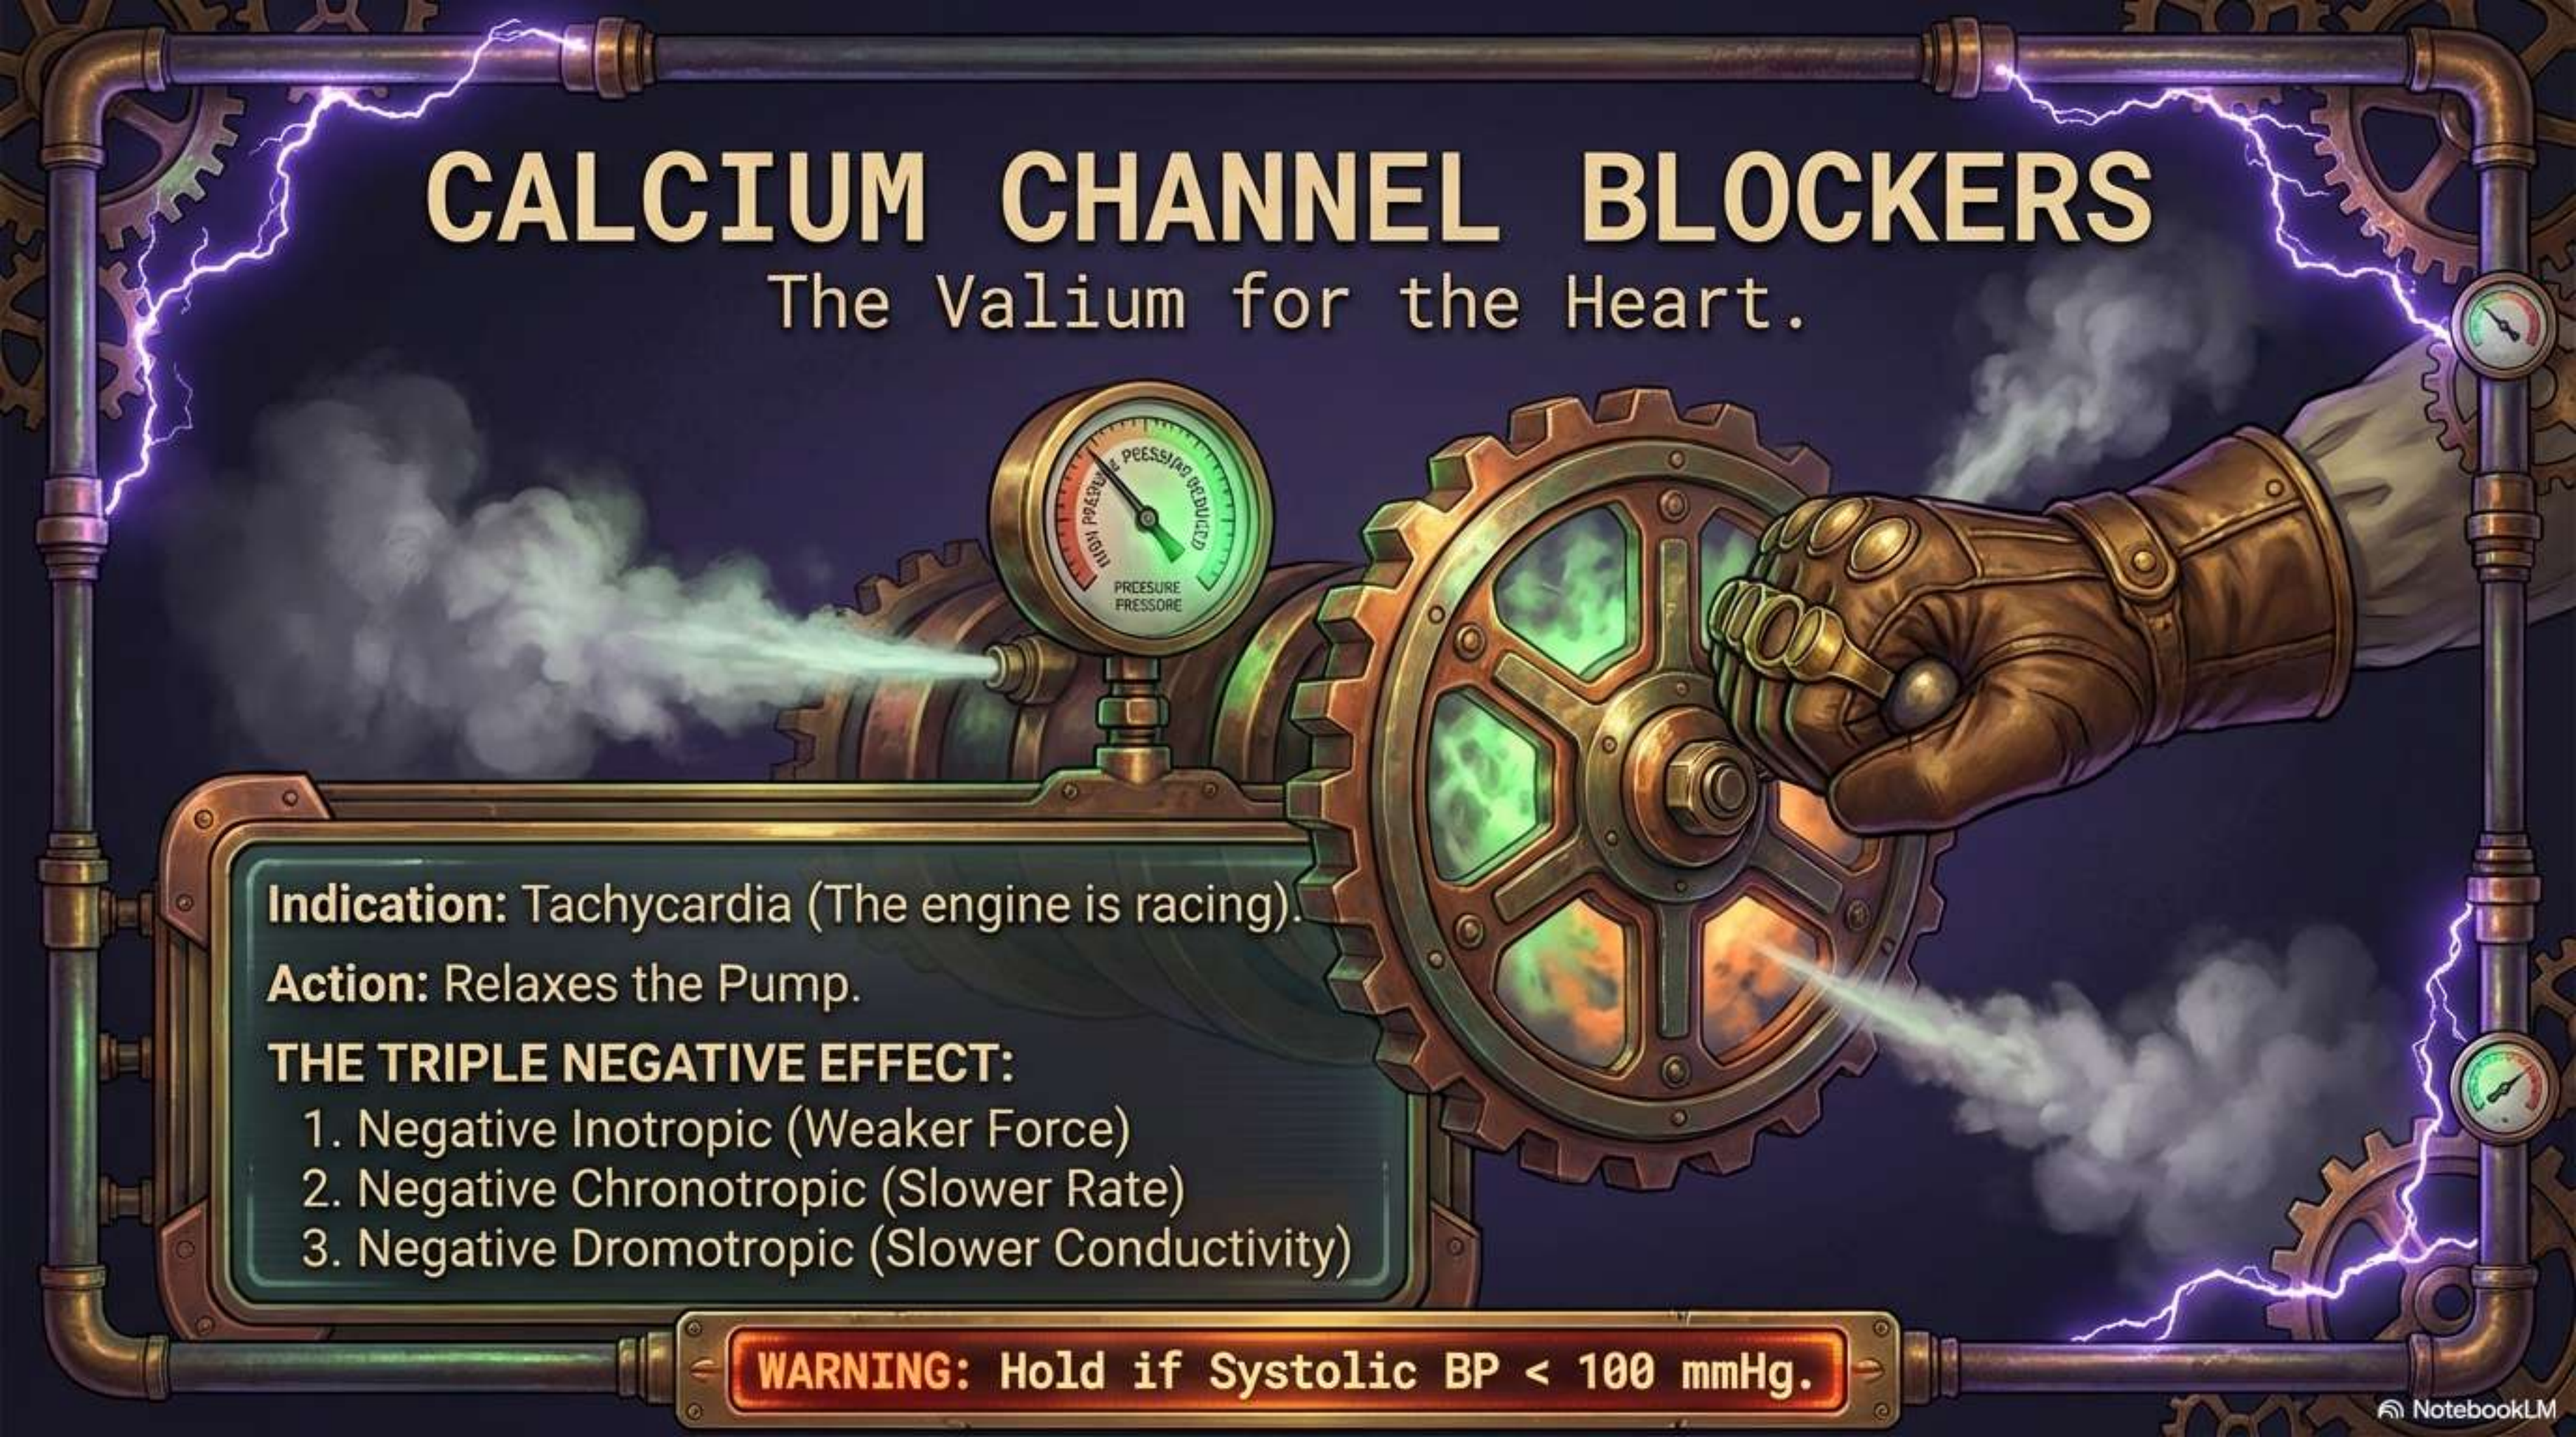
TROPONIN: THE ISCHEMIC THRESHOLD

MECHANISM: Myocardial Necrosis (Engine Block Damage).
NORMAL: Troponin I < 0.035 ng/mL.
CRITICAL: Any Elevation = Myocardial Infarction.
DIFFERENTIAL DIAGNOSIS:
- BNP = STRETCH (Chronic Load)
- TROPONIN = DEATH (Acute Ischemia)

NotebookLM

CALCIUM CHANNEL BLOCKERS

The Valium for the Heart.



Indication: Tachycardia (The engine is racing).

Action: Relaxes the Pump.

THE TRIPLE NEGATIVE EFFECT:

1. Negative Inotropic (Weaker Force)
2. Negative Chronotropic (Slower Rate)
3. Negative Dromotropic (Slower Conductivity)

WARNING: Hold if Systolic BP < 100 mmHg.

NotebookLM

ELECTRICAL FAILURE: LETHAL RHYTHMS

V-FIB: CHAOTIC / NO OUTPUT.

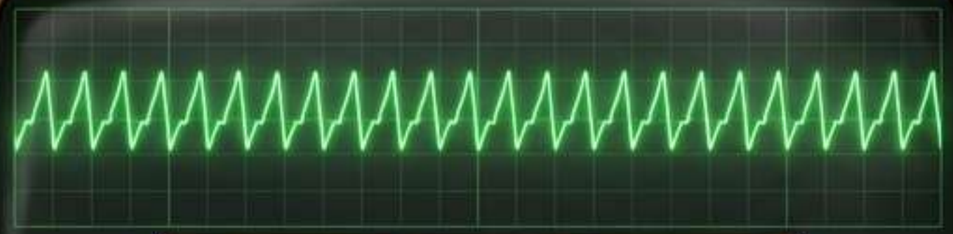
PROTOCOL: D-Fib (Defibrillation).

ASYSTOLE: SPARK FAILURE.

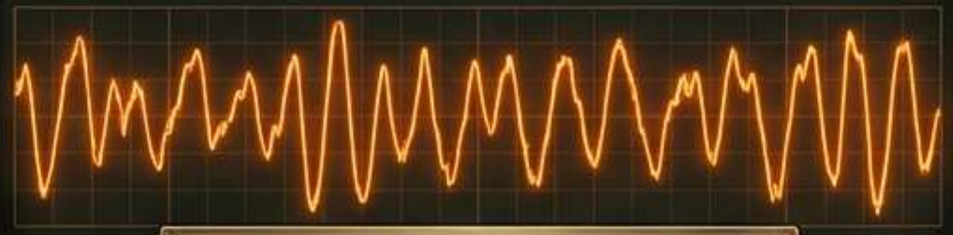
PROTOCOL: Epinephrine + Atropine.

NotebookLM

Electrical Failure: Ventricular & Atrial



ATRIAL FLUTTER (Sawtooth)



V-TACH (Patterned Chaos)

PVCs / V-Tach Protocol:
Amiodarone or Lidocaine.

Atrial Arrhythmia Protocol (ABCD):

A: Adenocard (Fast Push)
B: Beta Blockers
C: Calcium Channel Blockers
D: Digitalis

NotebookLM

Rye

ACID-BASE ALCHEMY

pH (MASTER GAUGE):

7.35 - 7.45

PaCO2 (LUNG EXHAUST):

35 - 45 mmHg

HCO3 (KIDNEY FILTER):

22 - 26 mEq/L

Roboto Mono

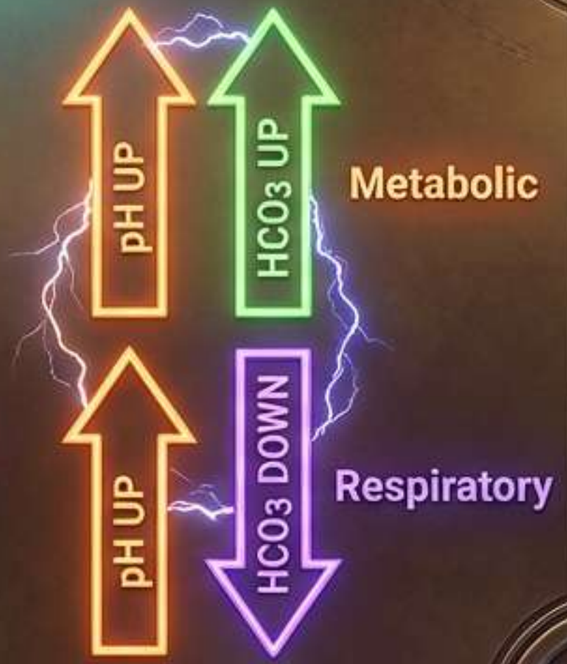
The machine operates on a precise fuel mixture.
Mathematical deduction is required.

NotebookLM

THE RULE OF THE B's

If the pH and the Bicarb are BOTH in the same direction, then it is MetaBOLIC.

pH DOWN + HCO_3 DOWN = Metabolic Acidosis
pH UP + HCO_3 UP = Metabolic Alkalosis
Opposite Directions = Respiratory



NotebookLM

Rye

SYMPTOM PREDICTION: THE pH VELOCITY

As the pH goes, so goes my patient.

ALKALOSIS (pH UP)

HCO_3 UP

HCO_3 DOWN

- Irritability
- Hyper-reflexia (+3/+4)
- Tachypnea
- Tachycardia
- Seizures.

ACIDOSIS (pH DOWN)

pH UP

HCO_3 DOWN

- Lethargy
- Bradycardia
- Hypo-reflexia (+1)
- Paralytic Ileus
- Coma.

NotebookLM

Rye

THE INVERSE POTASSIUM LAW

As the pH goes, so goes my patient, EXCEPT for Potassium.

pH DOWN (Acidosis) = Potassium UP (Hyperkalemia)
Risk: Cardiac Arrest.

pH UP (Alkalosis) = Potassium DOWN (Hypokalemia)
Risk: Muscle Cramps / Arrhythmias.

NotebookLM

RESPIRATORY DIAGNOSTICS: THE BELLOWS TEST

Step 1: Is it Lung? → YES → Respiratory

Step 2: Over-ventilating or Under-ventilating?

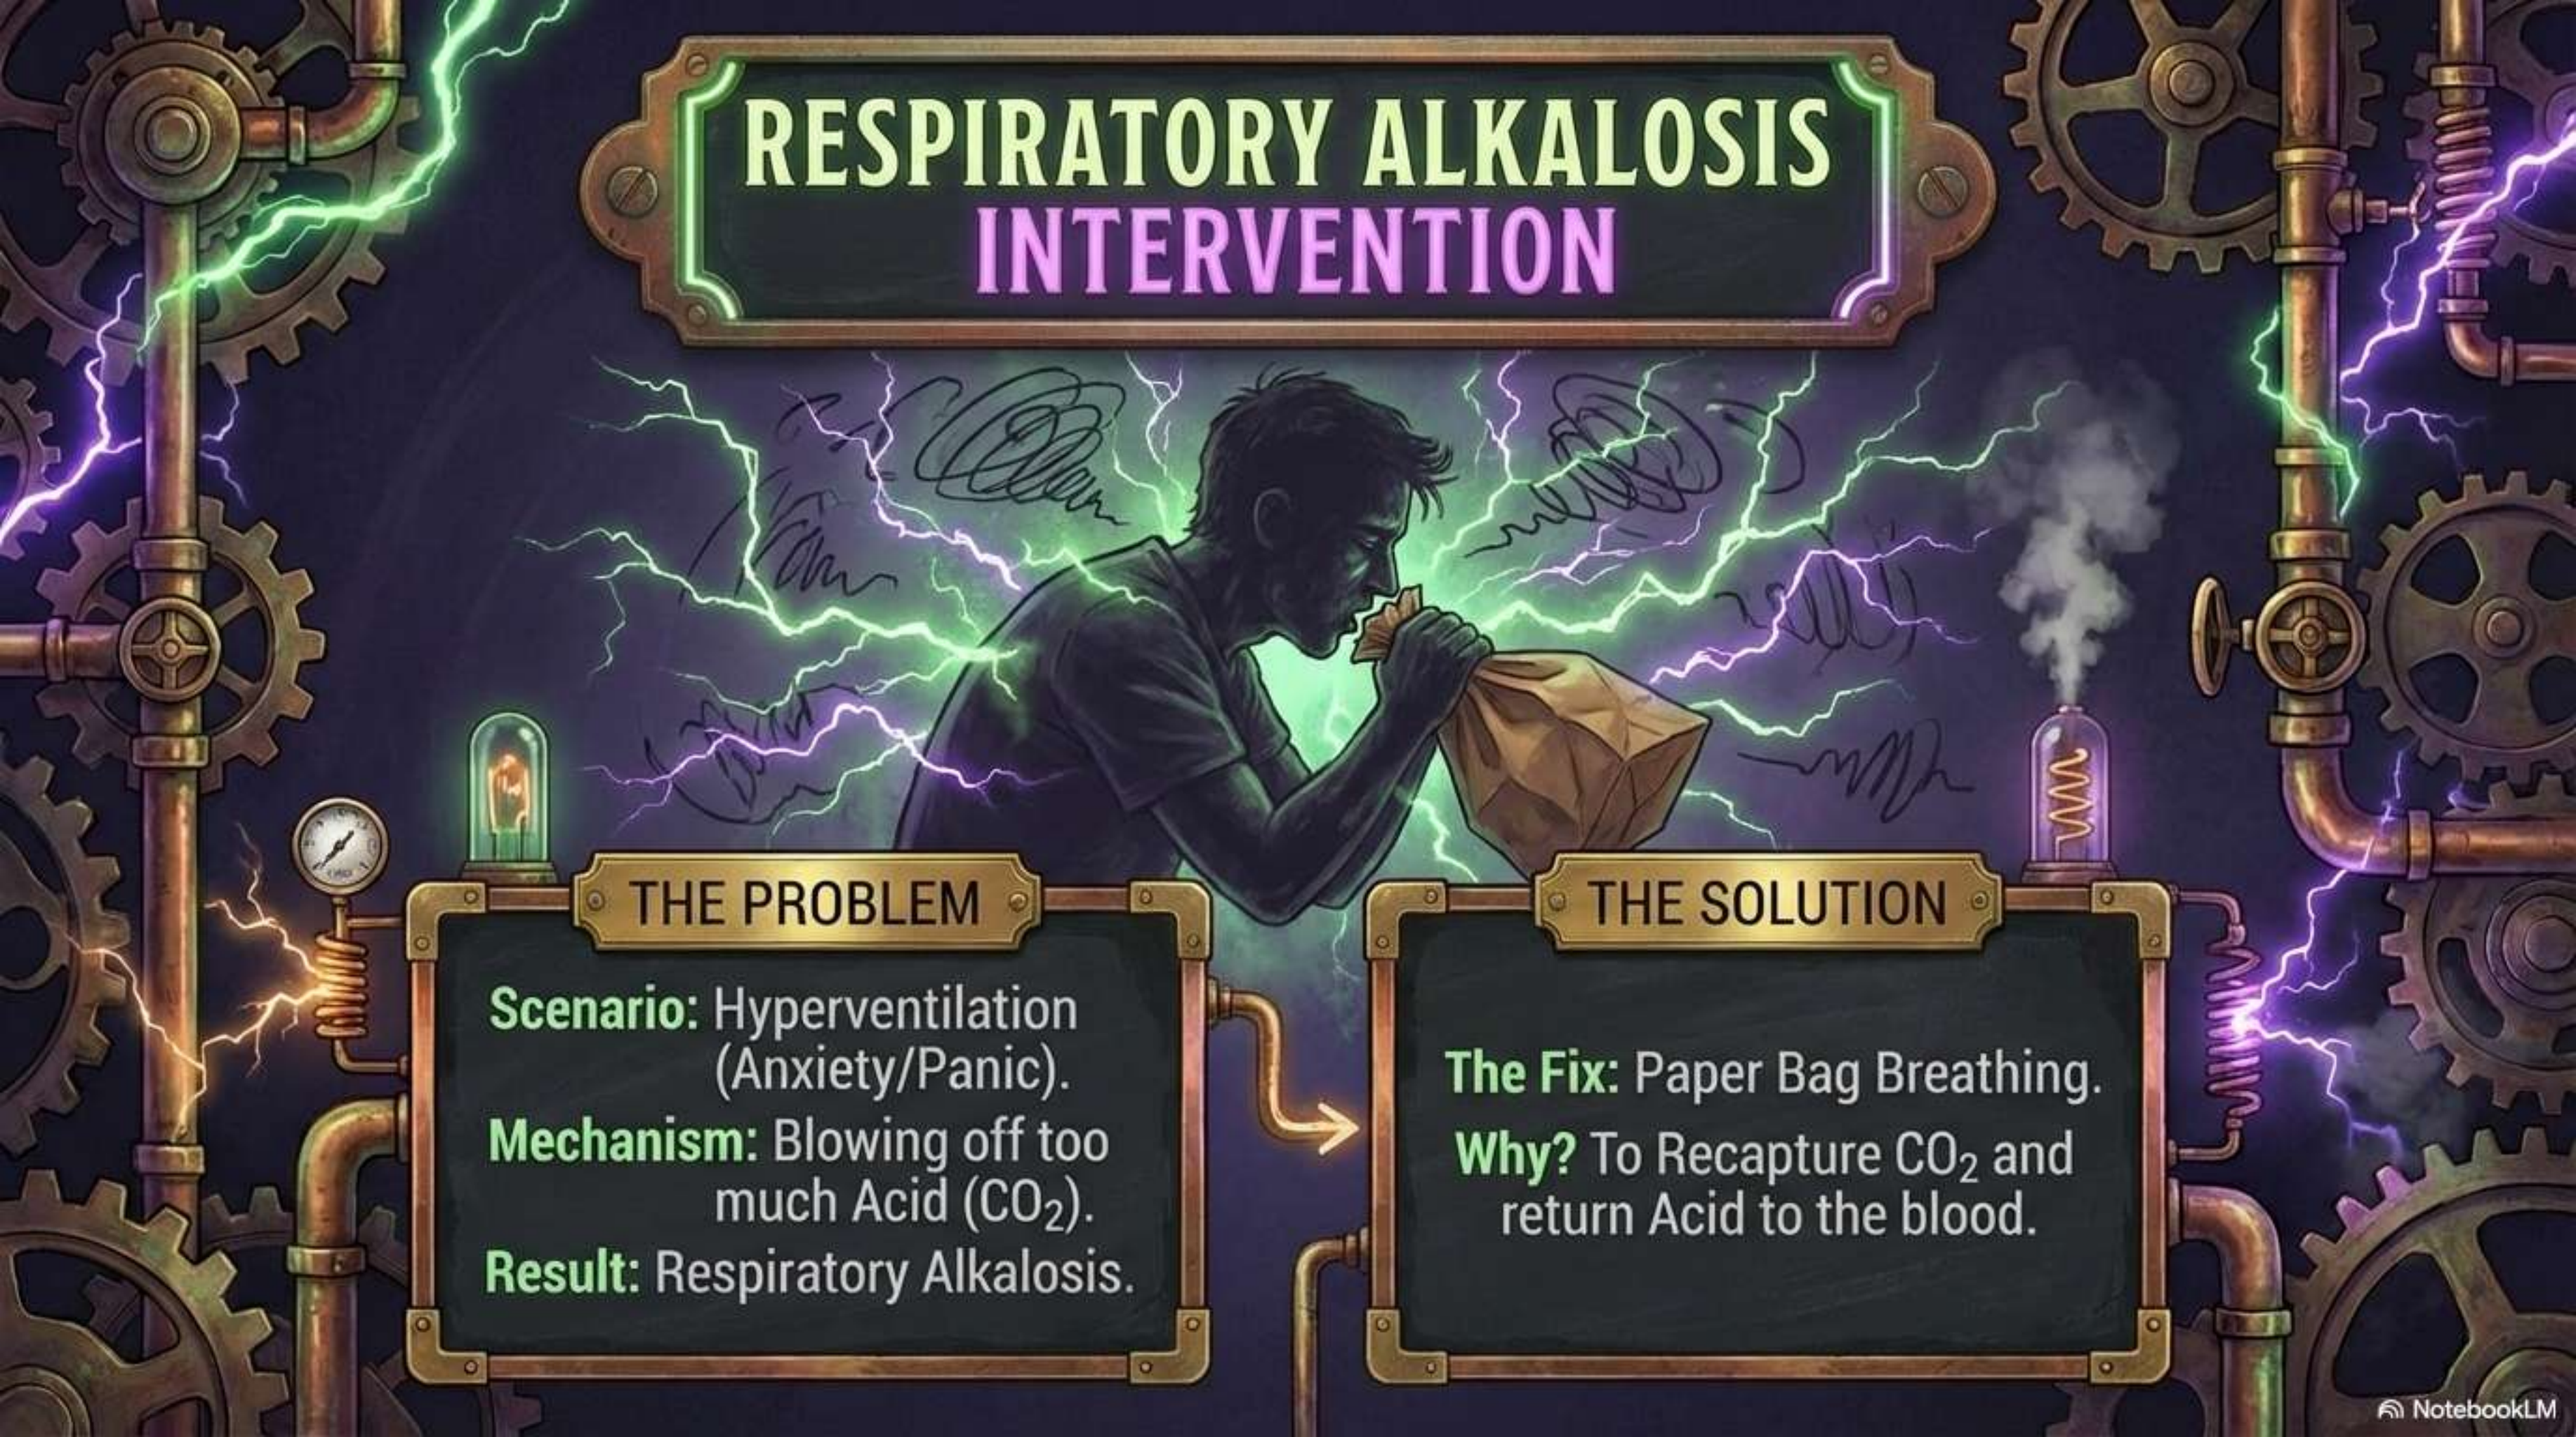
Over-ventilating (Fast)
= Blowing off CO_2
= ALKALOSIS

Under-ventilating (Slow)
= Retaining CO_2
= ACIDOSIS

Examples: Overdose/COPD = Under-ventilating = Acidosis

NotebookLM

RESPIRATORY ALKALOSIS
INTERVENTION



THE PROBLEM

Scenario: Hyperventilation (Anxiety/Panic).

Mechanism: Blowing off too much Acid (CO_2).

Result: Respiratory Alkalosis.

THE SOLUTION

The Fix: Paper Bag Breathing.

Why? To Recapture CO_2 and return Acid to the blood.

NotebookLM

THE COMPENSATORY GASP: MAC KUSSMAUL

Deep, Labored Breathing Pattern = KUSSMAUL RESPIRATIONS.

The Law: Kussmaul is **ONLY** seen in Metabolic Acidosis (MAC).

Metabolic Diagnostics:

1. Vomiting/Suction = Losing Acid = Metabolic Alkalosis.
2. Diarrhea = Losing Base = Metabolic Acidosis.
3. **Default Rule:** If it's not Lung, and not Vomiting, pick Metabolic Acidosis.

NotebookLM

ARTIFICIAL BELLOWS: ALARM PROTOCOLS

HIGH PRESSURE ALARM

Cause: Increased Resistance (Obstruction).

1. Unkink Tube.
2. Empty Water.
3. Clear Mucus (Turn/Cough).
4. Suction.

LOW PRESSURE ALARM

Cause: Decreased Resistance (Disconnection).

1. Reconnect Main Tubing.
2. Reconnect O2 Sensor.

NotebookLM

THE SURVIVAL CONSOLE: TRIAGE HIERARCHY

MAC KUSSMAUL

(A) LOW PRIORITY

Abnormal but expected.

Action: Do nothing. (e.g., Creatinine).

(B) MONITOR

Be concerned.

Action: Assess. (e.g., BNP, Sodium).

(C) CRITICAL

Action Required.

Hold/Assess/ Prepare/Call. (e.g., INR > 4).

(D) DEADLY

DO SOMETHING NOW.

Stay with patient. (e.g., pH 6, K+ 6).

NotebookLM

LEVEL C ALERTS: COAGULATION

INR > 4.0

Meaning: Hemorrhage Risk (Warfarin Overdose).

Protocol:

1. **HOLD** Warfarin.
2. **ASSESS** for Bleeding.
3. **PREPARE** Vitamin K.
4. **CALL** Physician.

NotebookLM

LEVEL C ALERTS: IMMUNOCOMPROMISE

SEVERE NEUTROPENIA

Values: WBC < 5,000 | ANC < 500 | CD4 < 200 (AIDS).

Protocol: NEUTROPENIC PRECAUTIONS.

- Strict Hygiene.
- No Fresh Flowers or Potted Plants.
- No Raw Fruits/Vegetables.
- No Standing Water (No Pitchers >15 mins).
- No Sick Visitors.

NotebookLM

Rye

LEVEL D: IMMEDIATE SYSTEM FAILURE (PART I)

POTASSIUM (K+) > 6.0

Result: Cardiac Standstill.

Action: STAY with patient. Prepare Kayexalate + D5W/Insulin. Call MD.

pH in the 6s (e.g., 6.8)

Result: Severe Acidosis (Incompatible with life).

Action: Assess vitals. Call MD. Treat underlying cause immediately.

NotebookLM

OXYGEN
ZERO
20
40
60
80
100
120
LEVEL D: IMMEDIATE SYSTEM FAILURE (PART II)
CO2 > 60 mmHg: Respiratory Failure.
Action: Prepare to Intubate/Ventilate.
Roboto Mono
PO2 < 60 mmHg: Severe Hypoxia.
Action: Intubate/Ventilate.
Roboto Nono
Platelets < 40,000: Spontaneous Hemorrhage.
Action: Bleeding Precautions. Transfuse.
Roboto Mono
THE MASTER MECHANIST'S FINAL DIRECTIVE: TREAT THE PATIENT, NOT THE MONITOR.
